FinePoint Perception

Set up on your Mac or Windows PC

The app sends a recording session from your computer to the cloud, and shows all its cameras side by side.

In this guide

- What you need before you start
- Install the app, then open it again later
- Set your password and sign in
- Upload a session
- If something goes wrong, and how to update
- For the FinePoint team: add a person
- Links to every help page

1 Before you start

Check these things first. Each check takes a minute. The links open Apple's and Microsoft's own help pages.

On a Mac

What you need	How to check
A Mac with an Apple chip (M1 or newer)	Click the Apple menu, then **About This Mac**. A **Chip** line that says Apple M1, M2, M3 or newer is right. A **Processor** line that says Intel will not work. Mac computers with Apple silicon
macOS 14 or newer	The same window shows the macOS name and number. Sonoma 14, Sequoia 15 and Tahoe 26 are all fine. If yours is older, update it. Find out which macOS your Mac is using, Update macOS
About 3 GB of free space	Open **System Settings**, then **General**, then **Storage**. The bar shows how much is free. Free up storage space on Mac
Internet	Open any web page in Safari. If it loads, you are ready.

On a Windows PC

What you need	How to check
Windows 10 or 11, 64-bit	Right-click **Start**, then click **Settings**, **System** and **About**. Under **Device specifications**, **System type** must say 64-bit operating system, x64-based processor. Under **Windows specifications**, **Edition** says Windows 10 or Windows 11. Find information about your Windows device
About 3 GB of free space	Open **Settings**, then **System**, then **Storage**. The bar for the drive the system is on, usually **C:**, shows how much is free. Free up drive space in Windows
Internet	Open any web page in Microsoft Edge. If it loads, you are ready.

On both

What you need	How to check
From the FinePoint team	Two things: the **server address** (it starts with `https://`), and an **email with a set-password link**. Ask the FinePoint team if you have not got them.

You do not need to install anything else by hand: the installer adds what the app needs (part 10 lists it).

2 Install the app

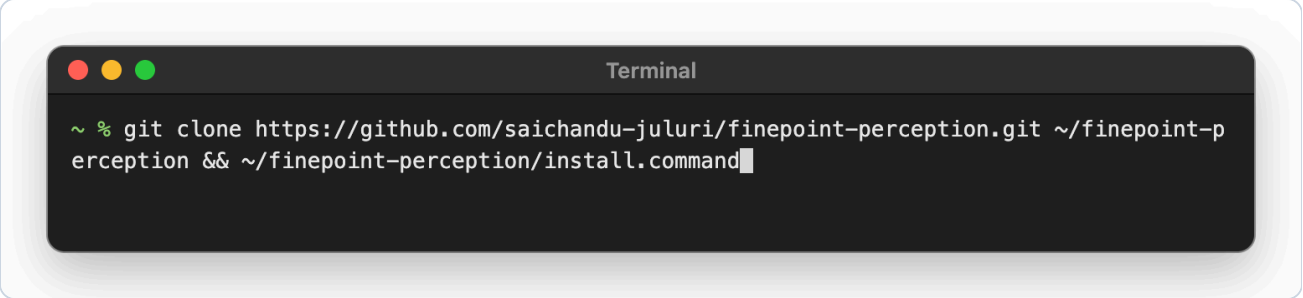

You do this once. It takes a few minutes.

On a Mac

1. **Open Terminal.** In Finder, open **Applications**, then **Utilities**, then double-click **Terminal**. Or press Command and Space together, type **Terminal** and press Return. Open or quit Terminal on Mac
2. **Paste this line into Terminal and press Return.** It is one command, even though it wraps onto two lines.

```
git clone https://github.com/saichandu-juluri/finepoint-perception.git ~/finepoint-perception &&
~/finepoint-perception/install.command
```

If pasting from this PDF does not work, copy the line from the project page instead (it is under **Install**).

Terminal with the line pasted in, just before pressing Return.

3. **If the Mac asks to install the command line developer tools, click Install.** When that is done, paste the line again and press Return.
4. **Wait.** Text scrolls by in Terminal. Warnings are normal. The first time takes a few minutes.
5. **The app opens in your browser.** You can leave Terminal open or close it.

2 Install the app continued

On a Windows PC

1. **Open PowerShell.** Click **Start**, type **PowerShell**, and click **Windows PowerShell**. Starting Windows PowerShell
2. **Paste this line into PowerShell and press Enter.** To paste, right-click in the window, or press Ctrl and V together. It is one command.

```
irm -useb https://raw.githubusercontent.com/saichandu-juluri/finepoint-perception/main/install.ps1 | iex
```

If pasting from this PDF does not work, copy the line from the project page instead (it is under **Install on Windows**).

PowerShell with the line pasted in, just before pressing Enter.

3. **Wait.** Text scrolls by in PowerShell. The first time takes a few minutes.
4. **The app opens in your browser.** You can leave PowerShell open or close it.

3 Open the app next time

You do not need Terminal or PowerShell again.

1. On a Mac, click **FinePoint Perception** in Launchpad (called Apps on newer Macs), or in the **Applications** folder of your home folder. On Windows, click **FinePoint Perception** in the **Start** menu or on the desktop.

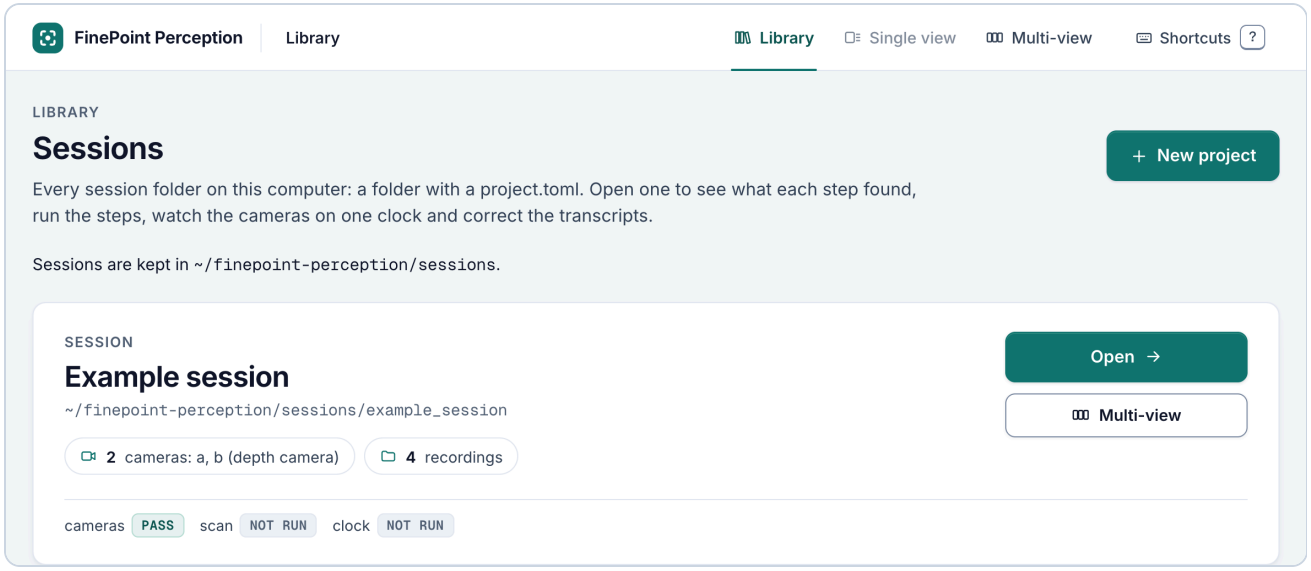

The app's icon on a Mac.

The shortcut on Windows.

2. The app opens in your browser on the **Library** page. It lists your sessions.

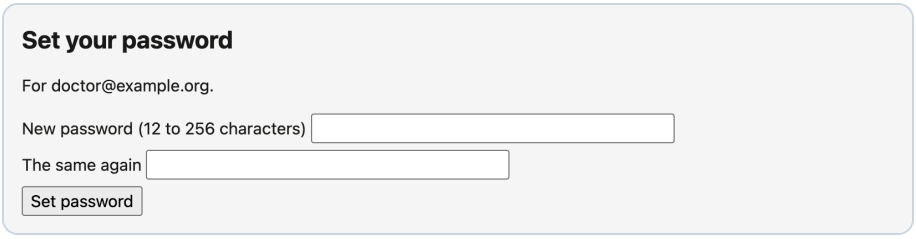

The Library. Each card is one session. **New project** adds one.

4 Set your password

The FinePoint team sends you an email with a set-password link.

1. Open the link from the email. A page called **Set your password** opens.

The set-password page shows your email.

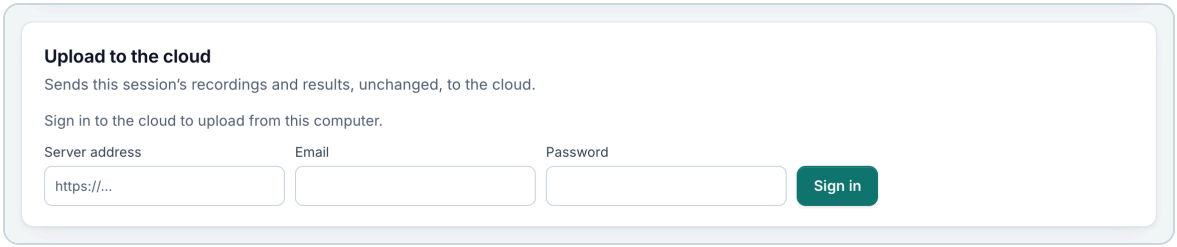

2. Type a password of **12 characters or more**, twice, and save it.

> The link works once, and for 72 hours. If it has run out, ask the FinePoint team for a new link.

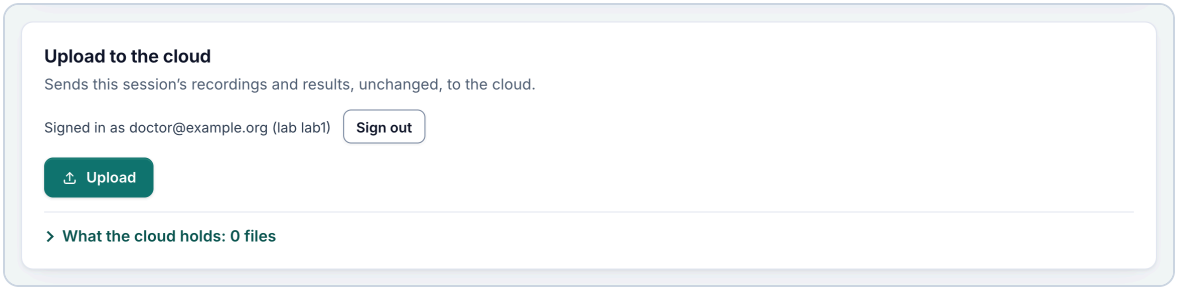

5 Sign in the first time

You sign in on a session's page, under **Upload to the cloud**, after you make your first project in part 6. You do this once per computer.

1. Type the **server address** from the FinePoint team, your **email** and your **password**. Click **Sign in**.

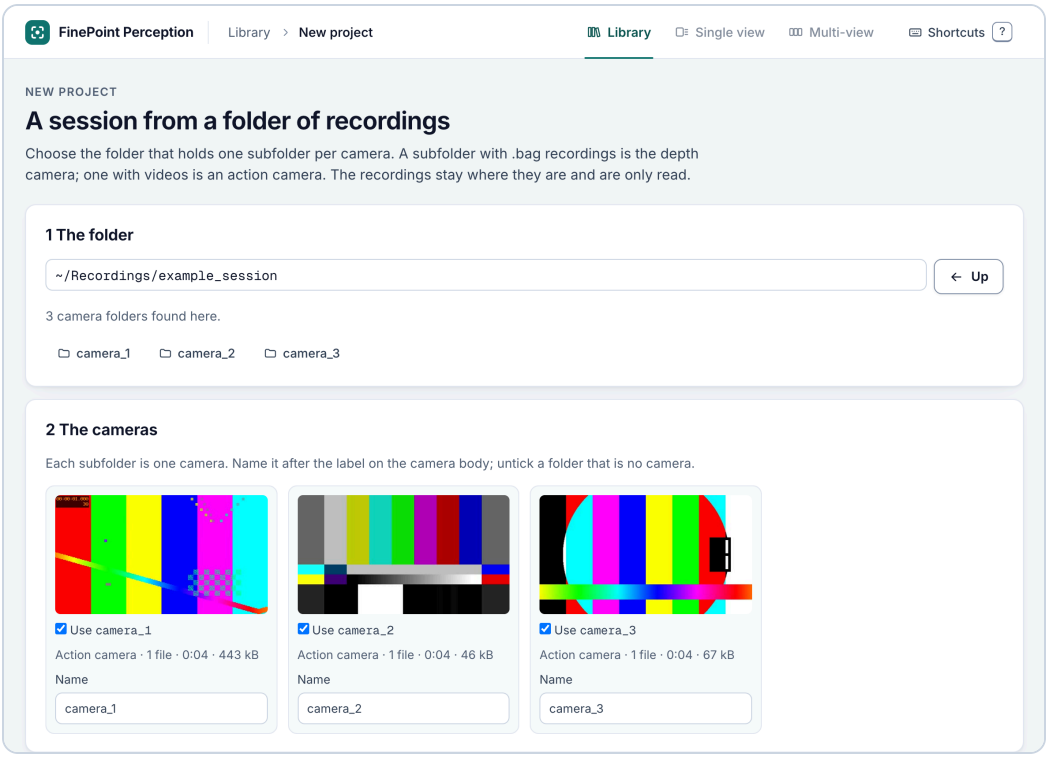

2. The box now says who you are signed in as, and shows **Upload**.

6 Upload a session

Make a project from the recording folder

1. On the Library page, click **New project**.
2. Go to the recording folder, the one with one folder per camera inside. Click a folder name to open it, or **Up** to go back. On Windows, click a drive, such as **E:** for a USB drive or a memory card, to open it. If the Mac asks whether the app may open a folder or a drive, click **Allow**. (Allow an app to open folders)
3. Check the camera names. Leave the board numbers as they are.
4. Type a session name and click **Create the project**. The session's page opens.

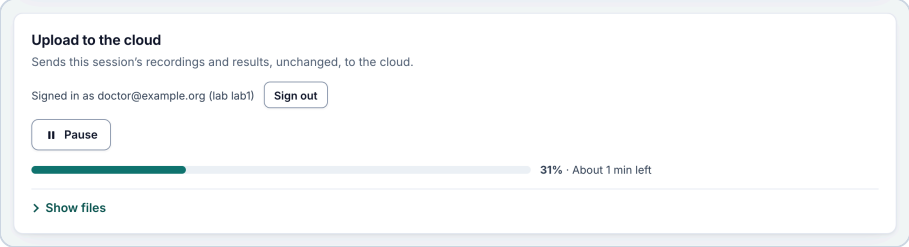

The New project page. Here it found three camera folders. Scroll down for the board numbers and the session name.

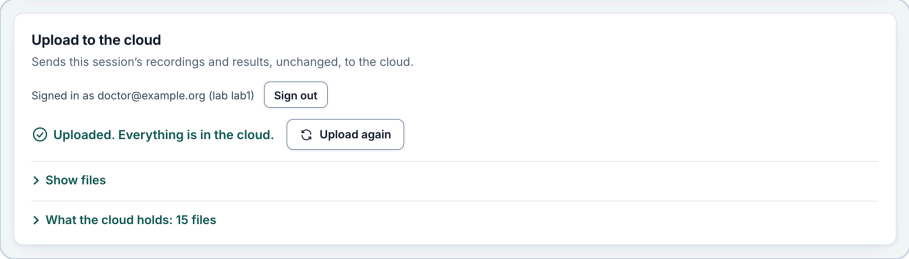

6 Upload a session continued

Send it to the cloud

1. On the session's page, sign in the first time only (see part 5). Then click **Upload**.
2. The bar shows how far the upload is and the time left.

3. It is done when the page says **Uploaded. Everything is in the cloud.**

Pause stops the upload, and **Resume** carries on where it stopped. You can close the browser at any time. After a restart of the computer, click the app's icon and the upload carries on.

7 If something goes wrong

- **The page asks you to sign in again.** Sign in again under **Upload to the cloud**. If you see **Sign out**, click it first.
- **The server address changed.** Ask the FinePoint team for the new one. Click **Sign out**, then sign in again with the new address.
- **Windows stops the install**, with red text in PowerShell or a security warning. Send the FinePoint team a screenshot. On a hospital computer, the hospital's IT may need to allow the install first.
- **Anything else.** Send the FinePoint team a screenshot.

8 Update the app

When the FinePoint team says there is a new version, update the app as below. It works like the install, and then the app opens in your browser. An upload carries on.

On a Mac, open Terminal, paste this line and press Return.

```
git -C ~/finepoint-perception pull && ~/finepoint-perception/install.command
```

On Windows, open PowerShell, paste the install line again and press Enter.

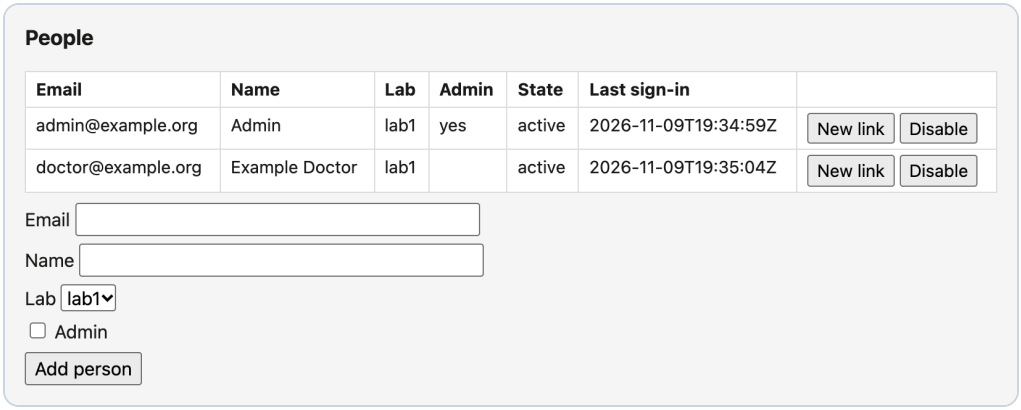

```
irm -useb https://raw.githubusercontent.com/saichandu-juluri/finepoint-perception/main/install.ps1 | iex
```

9 For the FinePoint team

The admin page is the server address followed by `/admin`. Sign in there with your admin account's email and password.

Add a person

1. Under **People**, type the person's email and name, pick their lab, and click **Add person**. Tick **Admin** only for another FinePoint team member.

Email	Name	Lab	Admin	State	Last sign-in	
admin@example.org	Admin	lab1	yes	active	2026-11-09T19:34:59Z	New link Disable
doctor@example.org	Example Doctor	lab1		active	2026-11-09T19:35:04Z	New link Disable

2. The page shows their set-password link once. Copy the whole link into an email to them. The server sends no email by itself.

Email	Name	Lab	Admin	State	Last sign-in	
admin@example.org	Admin	lab1	yes	active	2026-11-09T19:37:07Z	New link Disable
doctor@example.org	Example Doctor	lab1		invited		New link Disable

Your link starts with the server address. The person shows as **invited** until they set a password.

Other buttons

- **New link** makes a new set-password link, for example when the old one ran out or the person forgot their password.
- **Disable** stops the person from signing in and uploading. **Enable** undoes it.

10 Links

Every link in this guide, in one place.

The installer takes care of these

You do not need to install anything else by hand. The links are here only if you want to read more.

Tool	What it is
Command line developer tools (Mac)	Apple's free tools. The Mac offers them during the install. Installing the command-line tools
Git	On a Mac it comes with the developer tools: Git for macOS. On Windows the installer brings its own; you do not need Git for Windows.
pixi	Sets up what the app needs to run. The installer adds it. pixi installation
A web browser	The app opens in your browser. Safari is on every Mac, and Microsoft Edge on every Windows PC. Safari guide. Chrome also works: Download Chrome
