FinePoint Perception

Set up on your Mac

The app sends a recording session from your Mac to your lab's cloud, and shows all its cameras side by side.

In this guide

- What you need before you start
- Install the app, then open it again later
- Set your password and sign in
- Upload a session
- If something goes wrong, and how to update
- For the FinePoint team: add a person
- Links to every help page

1 Before you start

Check these five things first. Each check takes a minute. The links open Apple's own help pages.

What you need	How to check
A Mac with an Apple chip (M1 or newer)	Click the Apple menu, then **About This Mac**. A **Chip** line that says Apple M1, M2, M3 or newer is right. A **Processor** line that says Intel will not work. Mac computers with Apple silicon
macOS 14 or newer	The same window shows the macOS name and number. Sonoma 14, Sequoia 15 and Tahoe 26 are all fine. If yours is older, update it. Find out which macOS your Mac is using, Update macOS
About 3 GB of free space	Open **System Settings**, then **General**, then **Storage**. The bar shows how much is free. Free up storage space on Mac
Internet	Open any web page in Safari. If it loads, you are ready.
From the FinePoint team	Two things: the **server address** (it starts with `https://`), and an **email with a set-password link**. Ask the FinePoint team if you have not got them.

The installer takes care of these

You do not need to install anything else by hand. The links are here only if you want to read more.

Tool	What it is
Command line developer tools	Apple's free tools. The Mac offers them during the install. Installing the command-line tools
Git	Comes with the developer tools. Git for macOS
pixi	Sets up what the app needs to run. The installer adds it. pixi installation
A web browser	The app opens in your browser. Safari is on every Mac. Safari guide. Chrome also works: Download Chrome

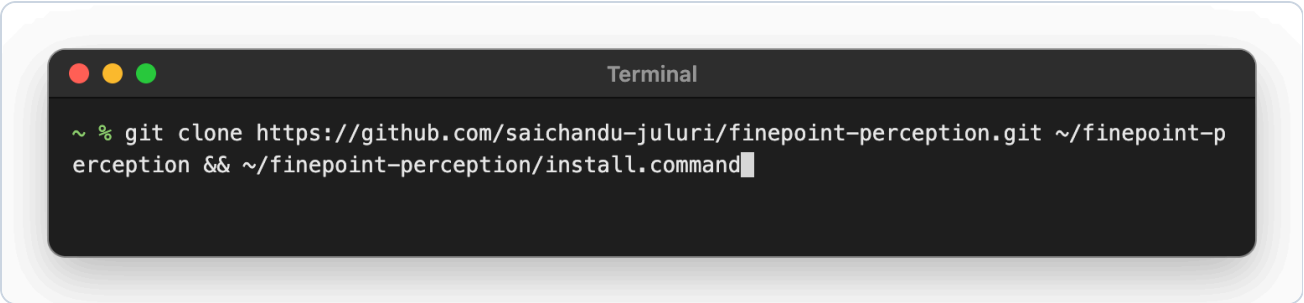

2 Install the app

You do this once. It takes a few minutes.

1. **Open Terminal.** In Finder, open **Applications**, then **Utilities**, then double-click **Terminal**. Or press Command and Space together, type **Terminal** and press Return. Open or quit Terminal on Mac
2. **Paste this line into Terminal and press Return.** It is one command, even though it wraps onto two lines.

```
git clone https://github.com/saichandu-juluri/finepoint-perception.git ~/finepoint-perception &&
~/finepoint-perception/install.command
```

If pasting from this PDF does not work, copy the line from the project page instead (it is under **Install**).

Terminal with the line pasted in, just before pressing Return.

3. **If the Mac asks to install the command line developer tools, click Install.** When that is done, paste the line again and press Return.
4. **Wait.** Text scrolls by in Terminal. Warnings are normal. The first time takes a few minutes.
5. **The app opens in your browser.** You can leave Terminal open or close it.

3 Open the app next time

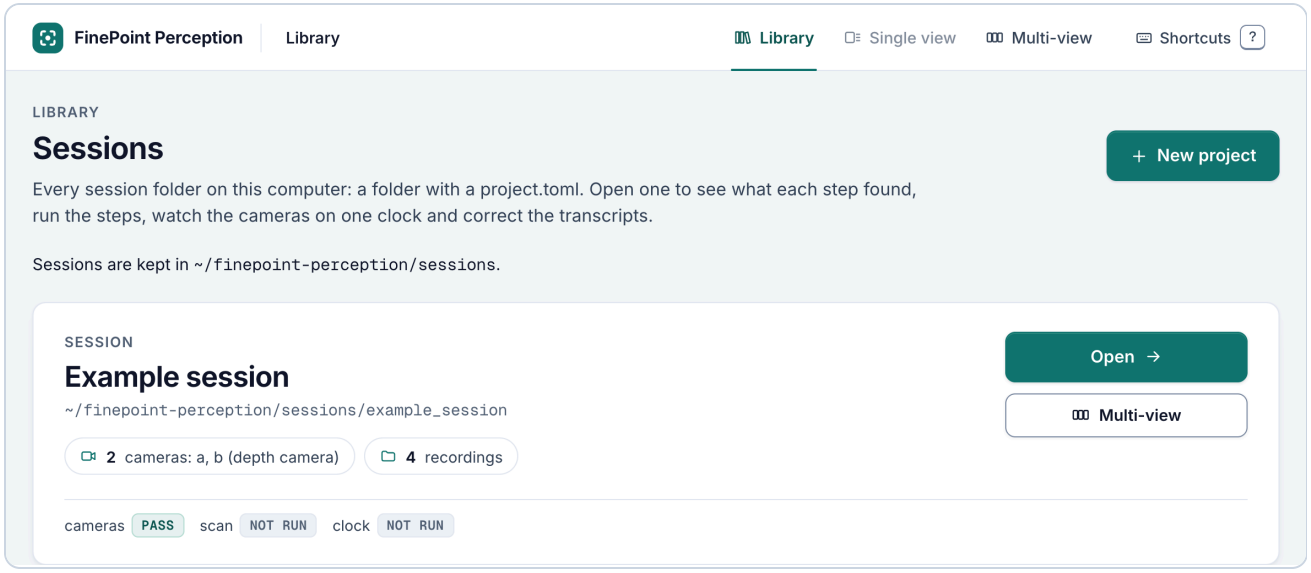

You do not need Terminal again.

1. Click **FinePoint Perception** in Launchpad (called Apps on newer Macs), or in the **Applications** folder of your home folder.

The app's icon.

2. The app opens in your browser on the **Library** page. It lists your sessions.

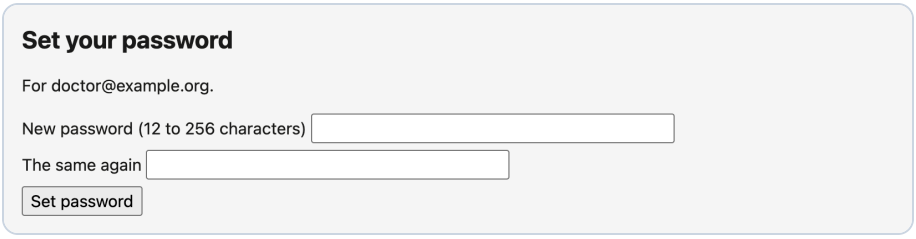

The Library. Each card is one session. **New project** adds one.

4 Set your password

The FinePoint team sends you an email with a set-password link.

1. Open the link from the email. A page called **Set your password** opens.

The set-password page shows your email.

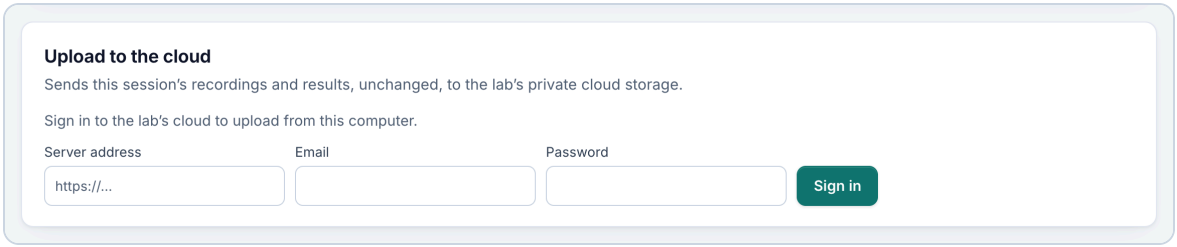

2. Type a password of **12 characters or more**, twice, and save it.

> The link works once, and for 72 hours. If it has run out, ask the FinePoint team for a new link.

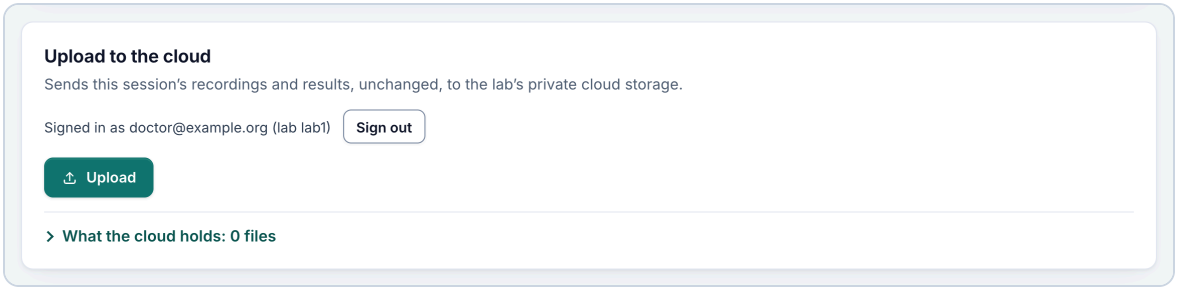

5 Sign in the first time

You sign in on a session's page, under **Upload to the cloud**, after you make your first project in part 6. You do this once per Mac.

1. Type the **server address** from the FinePoint team, your **email** and your **password**. Click **Sign in**.

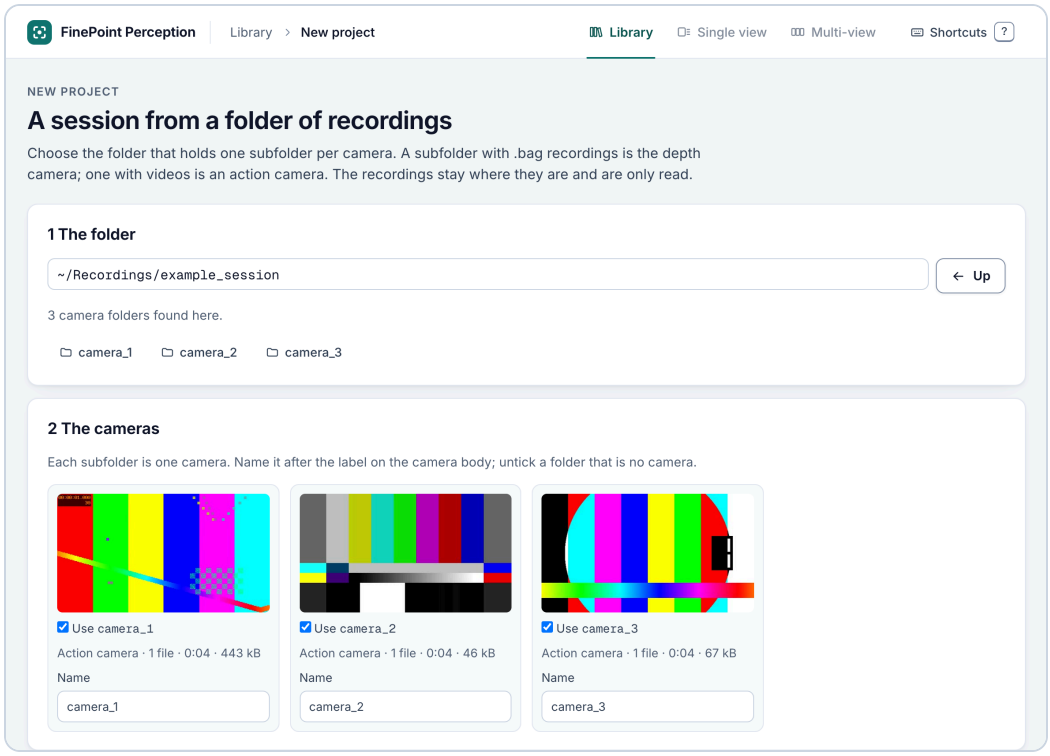

2. The box now says who you are signed in as, and shows **Upload**.

6 Upload a session

Make a project from the recording folder

1. On the Library page, click **New project**.
2. Go to the recording folder, the one with one folder per camera inside. Click a folder name to open it, or **Up** to go back. If the Mac asks whether the app may open a folder or a drive, click **Allow**. (Allow an app to open folders)
3. Check the camera names. Leave the board numbers as they are.
4. Type a session name and click **Create the project**. The session's page opens.

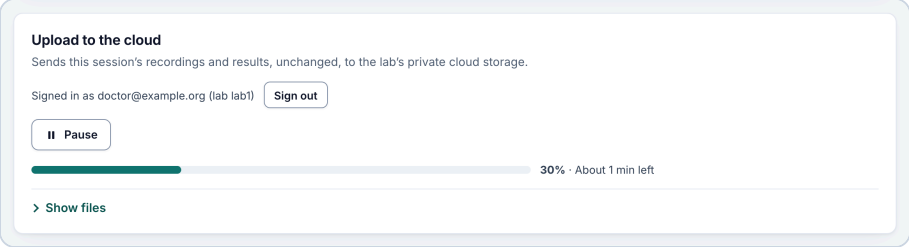

The New project page. Here it found three camera folders. Scroll down for the board numbers and the session name.

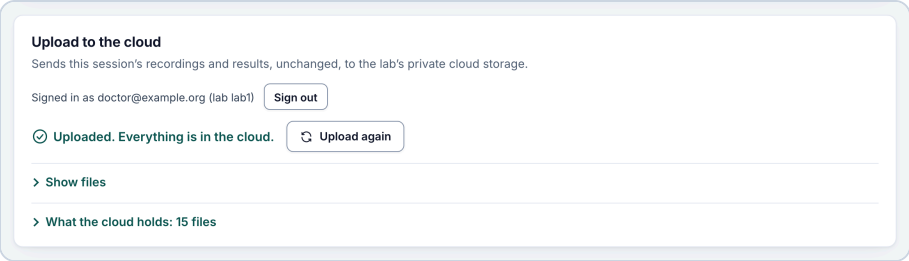

6 Upload a session continued

Send it to the cloud

1. On the session's page, sign in the first time only (see part 5). Then click **Upload**.
2. The bar shows how far the upload is and the time left.

3. It is done when the page says **Uploaded. Everything is in the cloud.**

Pause stops the upload, and **Resume** carries on where it stopped. You can close the browser at any time. After a restart of the Mac, click the app's icon and the upload carries on.

7 If something goes wrong

- **The page asks you to sign in again.** Sign in again under **Upload to the cloud**. If you see **Sign out**, click it first.
- **The server address changed.** Ask the FinePoint team for the new one. Click **Sign out**, then sign in again with the new address.
- **Anything else.** Send the FinePoint team a screenshot.

8 Update the app

When the FinePoint team says there is a new version, open Terminal, paste this line and press Return. It works like the install, and then the app opens in your browser.

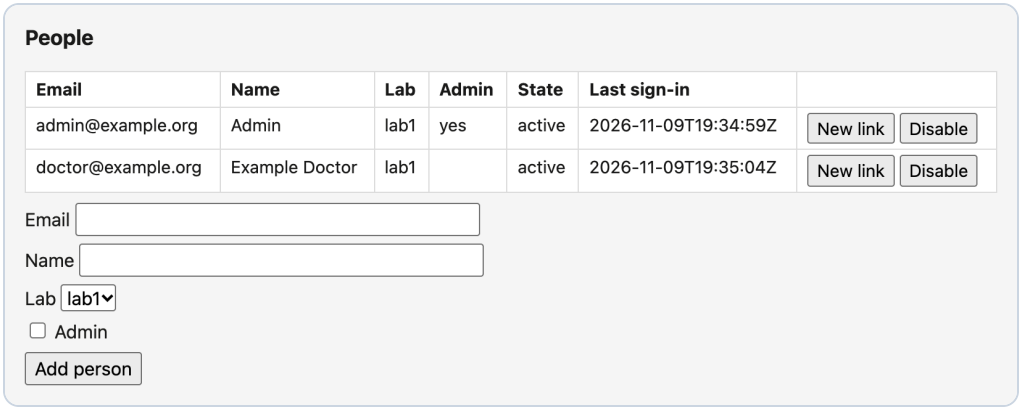

```
git -C ~/finepoint-perception pull && ~/finepoint-perception/install.command
```

9 For the FinePoint team

The admin page is the server address followed by `/admin`. Sign in there with your admin account's email and password.

Add a person

1. Under **People**, type the person's email and name, pick their lab, and click **Add person**. Tick **Admin** only for another FinePoint team member.

2. The page shows their set-password link once. Copy the whole link into an email to them. The server sends no email by itself.

Your link starts with your lab's server address. The person shows as **invited** until they set a password.

Other buttons

- **New link** makes a new set-password link, for example when the old one ran out or the person forgot their password.
- **Disable** stops the person from signing in and uploading. **Enable** undoes it.
